

Profile

Visionary theoretical physicist with a proven track record of overturning centuries of classical intuition and making the universe considerably more confusing for everyone. Demonstrated expertise in atomic structure, quantum mechanics, and hosting brilliant colleagues who then disagreed with me in internationally recognised debates. Comfortable with uncertainty — professionally and philosophically. Seeking senior advisory roles in physics, philosophy, or any institution willing to host intense, week-long arguments over the nature of reality.

Education

1905-1911: **Ph.D. in Physics** - University of Copenhagen

1903-1905: **B.Sc. in Physics** - University of Copenhagen

Experience

Director — Niels Bohr Institute, Copenhagen 1920-1962

Founded and directed one of the world's foremost research institutes. Recruited and hosted virtually every significant physicist of the 20th century, many of whom went on to win Nobel Prizes.

Professor of Physics — University of Copenhagen 1916-1920

Tenured full professor. Delivered lectures widely described as “profound,” “illuminating,” and “occasionally comprehensible.” Introduced the correspondence principle. Successfully modelled the hydrogen atom using quantised electron orbits, which turned out to be correct enough to win a Nobel Prize.

Research Physicist — Victoria University of Manchester 1912-1916

Collaborated with Rutherford following his nuclear model of the atom. Developed the Bohr model of the atom (1913), reconciling quantum theory with atomic stability. Rutherford reportedly called it “a very interesting paper” — high praise by any account.

Projects

Senior Consultant (Classified) — Manhattan Project 1943-1945

Provided senior scientific advisory support to Allied nuclear research after escaping German-occupied Denmark via fishing boat. The project eventually lead to world peace.
